

What is a Pump Track?

FACT SHEET

1

What is a Pump Track?

A pump track is a circuit of rollers, banked turns and jumps designed to be ridden by generating momentum by up and down body movements, instead of pedalling or pushing.

Originally designed for mountain bikes and BMX bikes, they are now used by skateboarders and scooter riders and are accessible for all abilities, including wheelchairs.

These facilities are extremely popular and friendly to all age groups, bringing local and visiting families together.

What is a Pump Track made out of?

Pump tracks can be made from dirt, wood, plywood, composite, concrete or asphalt. The Maryborough and Hervey Bay pump tracks will be made from asphalt.

Asphalt tracks are low maintenance and can withstand significant public use. They also can be designed in any formation allowing for a range of riding opportunities.
